

# Podman AI Lab

## Local AI Development Made Simple

18 Mar 2025

[meetup.com/k8s-sg](https://meetup.com/k8s-sg)

# We'll be discussing...

- Podman Introduction
- Podman Desktop Overview
- Podman AI Lab: Features
- Podman AI Lab: Deep Dive
- Local AI Benefits
- Demo
- Q&A

# Podman: Rootless Container Engine

- Podman: Open-source container engine.
- Rootless Architecture: Runs containers without root privileges.
- Enhanced Security: Safer container development.
- Docker Compatibility: Works with Docker images and commands.
- Podman is designed to work with OCI-compatible containers and container images.
- Flexible Foundation: For containerizing applications.

podman

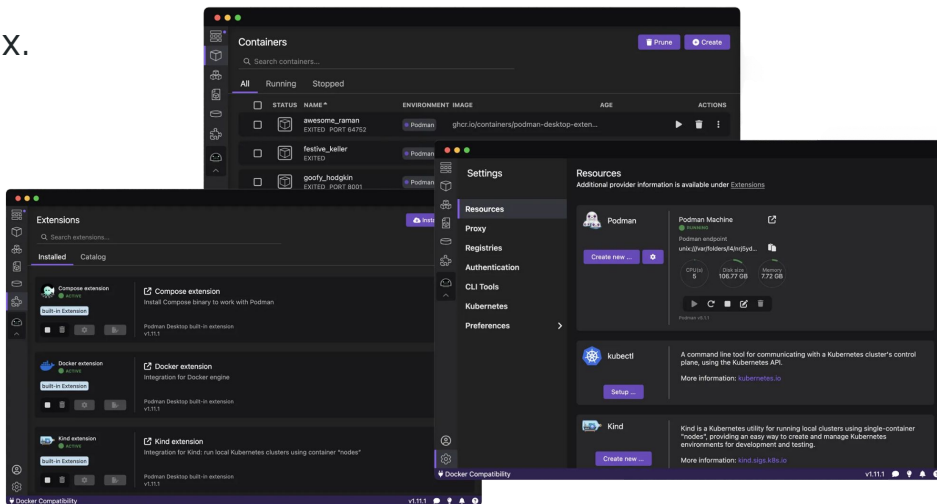

```
$ podman --help
Manage pods, containers and images

Usage:
  podman [options] [command]

Available Commands:
  artifact  Manage OCI artifacts
  attach    Attach to a running container
  auto-update  Auto update containers according to their auto-update policy
  build     Build an image using instructions from Containerfiles
  commit   Create new image based on the changed container
  compose  Run compose workloads via an external provider such as docker-compose or podman-compose
  container Manage containers
  cp       Copy files/folders between a container and the local filesystem
  create   Create but do not start a container
  diff     Display the changes to the object's file system
  events   Show podman system events
  exec     Run a process in a running container
  export   Export container's filesystem contents as a tar archive
  farm     Farm out builds to remote machines
  generate Generate structured data based on containers, pods or volumes
  healthcheck Manage health checks on containers
  help     Help about any command
  history  Show history of a specified image
  image    Manage images
  images   List images in local storage
  import   Import a tarball to create a filesystem image
  info     Display podman system information
  init     Initialize one or more containers
  inspect  Display the configuration of object denoted by ID
  kill     Kill one or more running containers with a specific signal
  kube     Play containers, pods or volumes from a structured file
  load     Load image(s) from a tar archive
  login    Log in to a container registry
  logout   Log out of a container registry
  logs     Fetch the logs of one or more containers
  machine  Manage a virtual machine
  manifest Manipulate manifest lists and image indexes
  mount    Mount a working container's root filesystem
  network  Manage networks
  pause    Pause all the processes in one or more containers
  pod      Manage pods
  port     List port mappings or a specific mapping for the container
  ps       List containers
  pull     Pull an image from a registry
  push     Push an image to a specified destination
  rename   Rename an existing container
  restart  Restart one or more containers
  rm       Remove one or more containers
  rmi      Remove one or more images from local storage
  run      Run a command in a new container
  save     Save image(s) to an archive
  search   Search registry for image
  secret   Manage secrets
  start    Start one or more containers
  stats    Display a live stream of container resource usage statistics
  stop     Stop one or more containers
  system   Manage podman
  tag      Add an additional name to a local image
  top      Display the running processes of a container
  umount   Unmount working container's root filesystem
  unpause  Unpause the processes in one or more containers
  unshare  Run a command in a modified user namespace
  untag    Remove a name from a local image
  update   Update an existing container
  version  Display the Podman version information
```

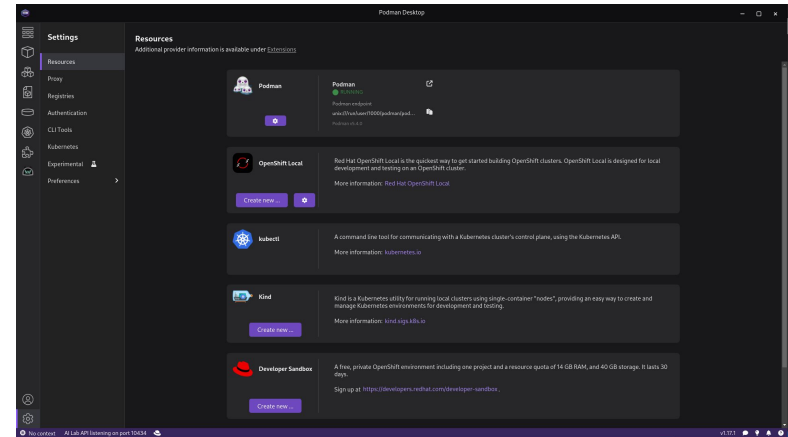

# Podman Desktop: Your Local Container Development Hub

- Free and open source!
- Control center for container workflows
- UI for managing containers, images, storage, local Kubernetes, OpenShift... and now AI
- It works across macOS, Windows, and Linux.

# Podman Desktop: Everything from localhost

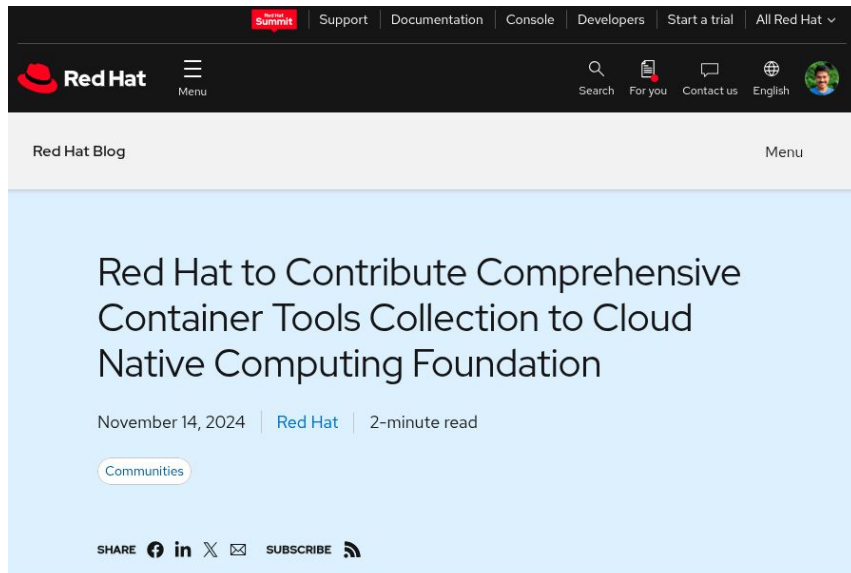

- Spin up Kubernetes clusters
- Connect to OpenShift local or Developer Sandbox

# Podman Desktop -> CNCF

**Red Hat Blog:** *The continued importance of cloud-native applications in an AI and hybrid cloud-centric world demands an open, more accessible ecosystem of development tools. Today, we're pleased to help drive cloud-native evolution further into the next-generation of IT with our intent to contribute a comprehensive set of container tools to the Cloud Native Computing Foundation (CNCF), including **bootc**, **Buildah**, **Composefs**, **Podman**, **Podman Desktop** and **Skopeo**.*

[< Back to all posts](#)

The continued importance of cloud-native applications in an AI and hybrid cloud-centric world demands an open, more accessible ecosystem of development tools. Today, we're pleased to help drive cloud-native evolution further into the next-generation of IT with our intent to contribute a comprehensive set of container tools to the Cloud Native Computing Foundation (CNCF), including **bootc**, **Buildah**, **Composefs**, **Podman**, **Podman Desktop** and **Skopeo**.

Upon acceptance by the CNCF, the contributed tools will become hosted projects –

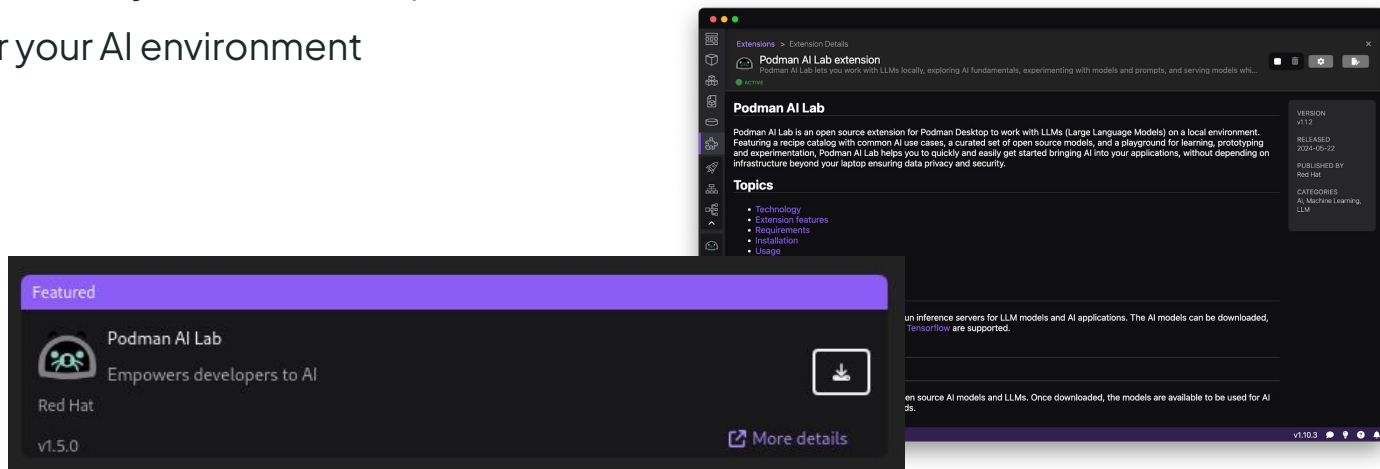

# Using CNCF projects with Podman Desktop

- minikube
- Backstage
- Dapr
- and many others

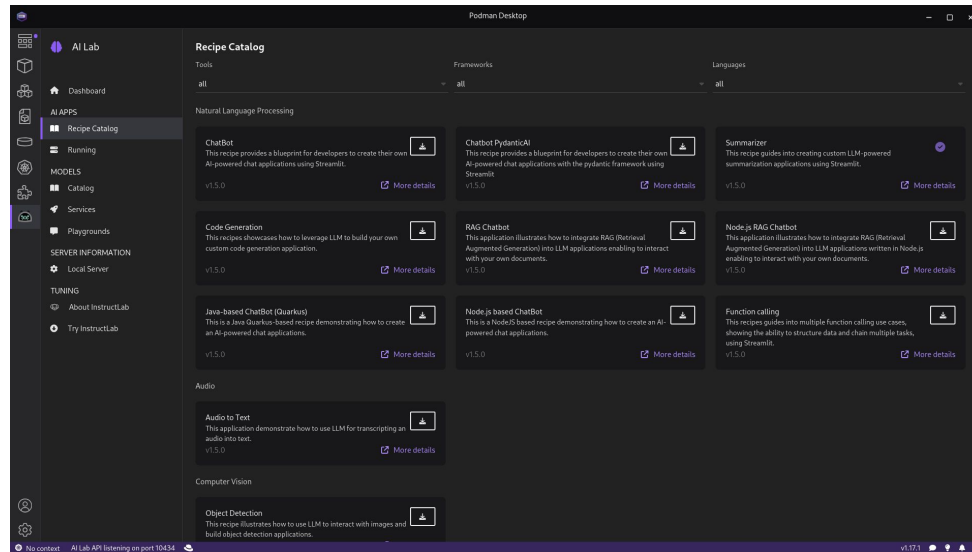

# Podman AI Lab: Features & Benefits

- Read to install extension
- Experiment, develop, and deploy AI applications without relying solely on cloud resources
- Privacy, reduced latency, offline development, and control over your AI environment

# Curated catalog of AI recipes,

Explore pre-built AI use cases with ready-to-use models and code examples. Easily swap models for comparison.

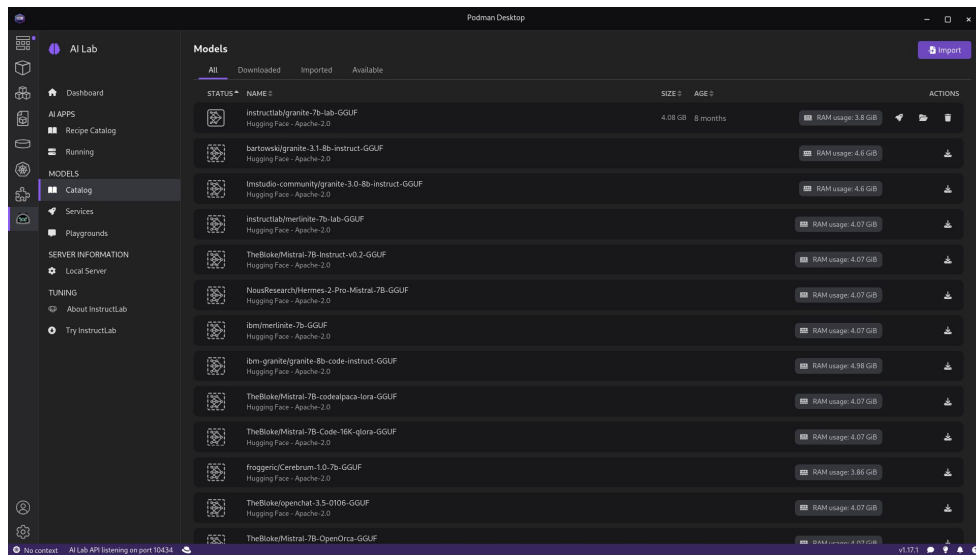

# Model Catalog

Access a selection of open-source LLMs with clear license information.

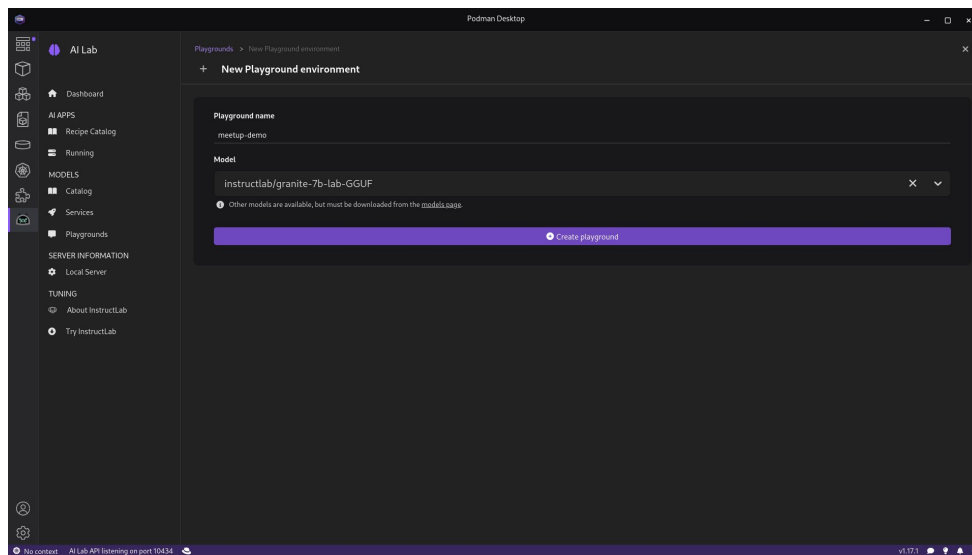

Import your own models in formats like GGUF

You can also import your own AI models to run within Podman AI Lab.

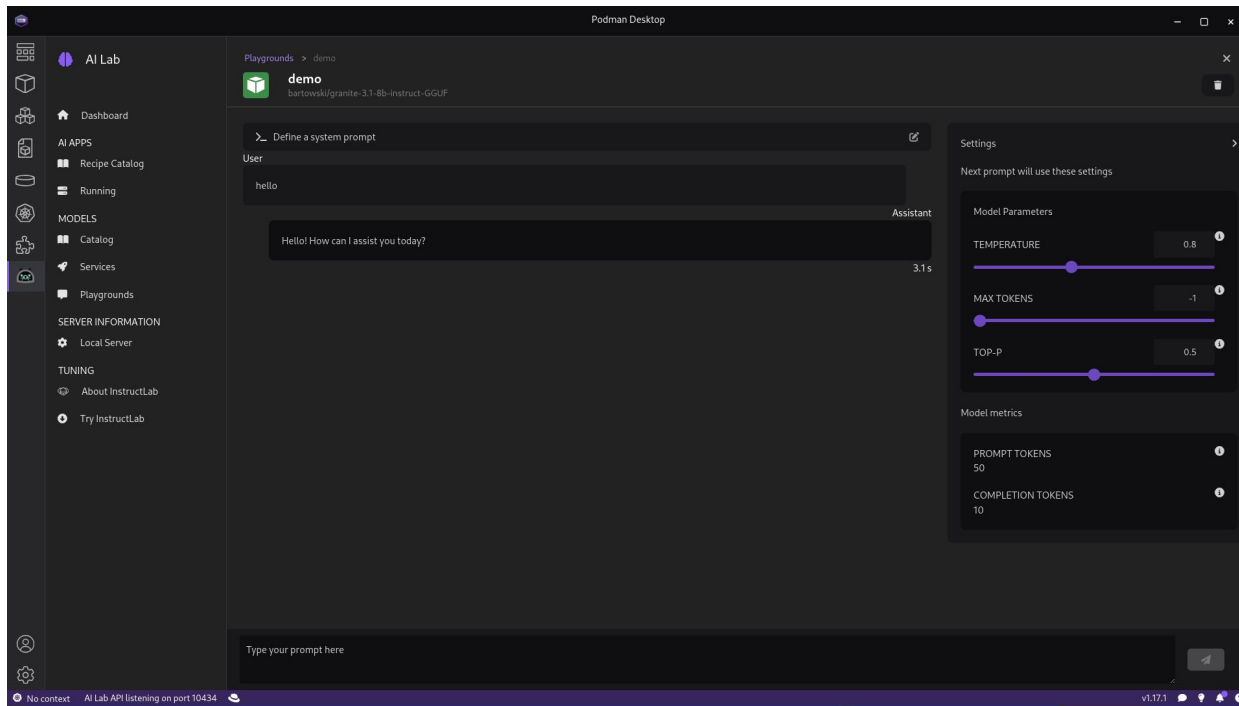

# Playground

Experiment with models, adjust parameters like temperature and max tokens, and fine-tune your prompts.

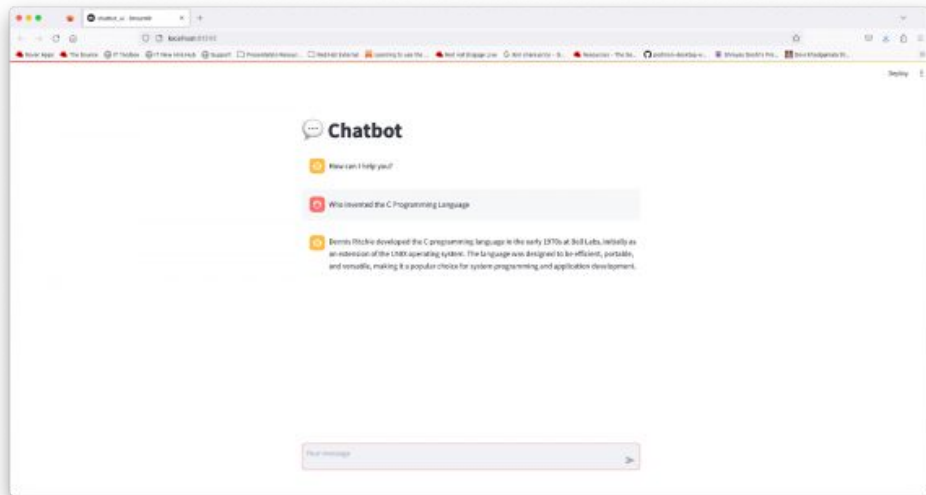

# Interact with Model in Playground

# Local Model Serving

Deploy model inference servers locally using containers, with OpenAI-compatible APIs for easy integration.

# Why Local AI Development?

- Data Privacy: Keep sensitive data on your local machine.
- Reduced Latency: Faster response times for development and testing.
- Offline Development: Work on AI projects without an internet connection.
- Cost-Effective: Minimize cloud resource usage.
- Control: Full control over your AI environment and dependencies.

# InstructLab: Collaborative LLM Customization

Leverage a taxonomy-guided synthetic data generation process and a multi-phase tuning framework to improve model performance.

- Open Collaboration
- Community-Driven LLM Improvement
- Simple Contribution Process
- Focus on Teachability
- Scalable LLM Enhancement
- Open Model Weights
- Empowering LLM Customization

# InstructLab: How it helps

## Taxonomy-driven Data Curation

Folder structure with  
Q&A pairs for topics to  
teach a model

## Large-scale Synthetic Data Generation

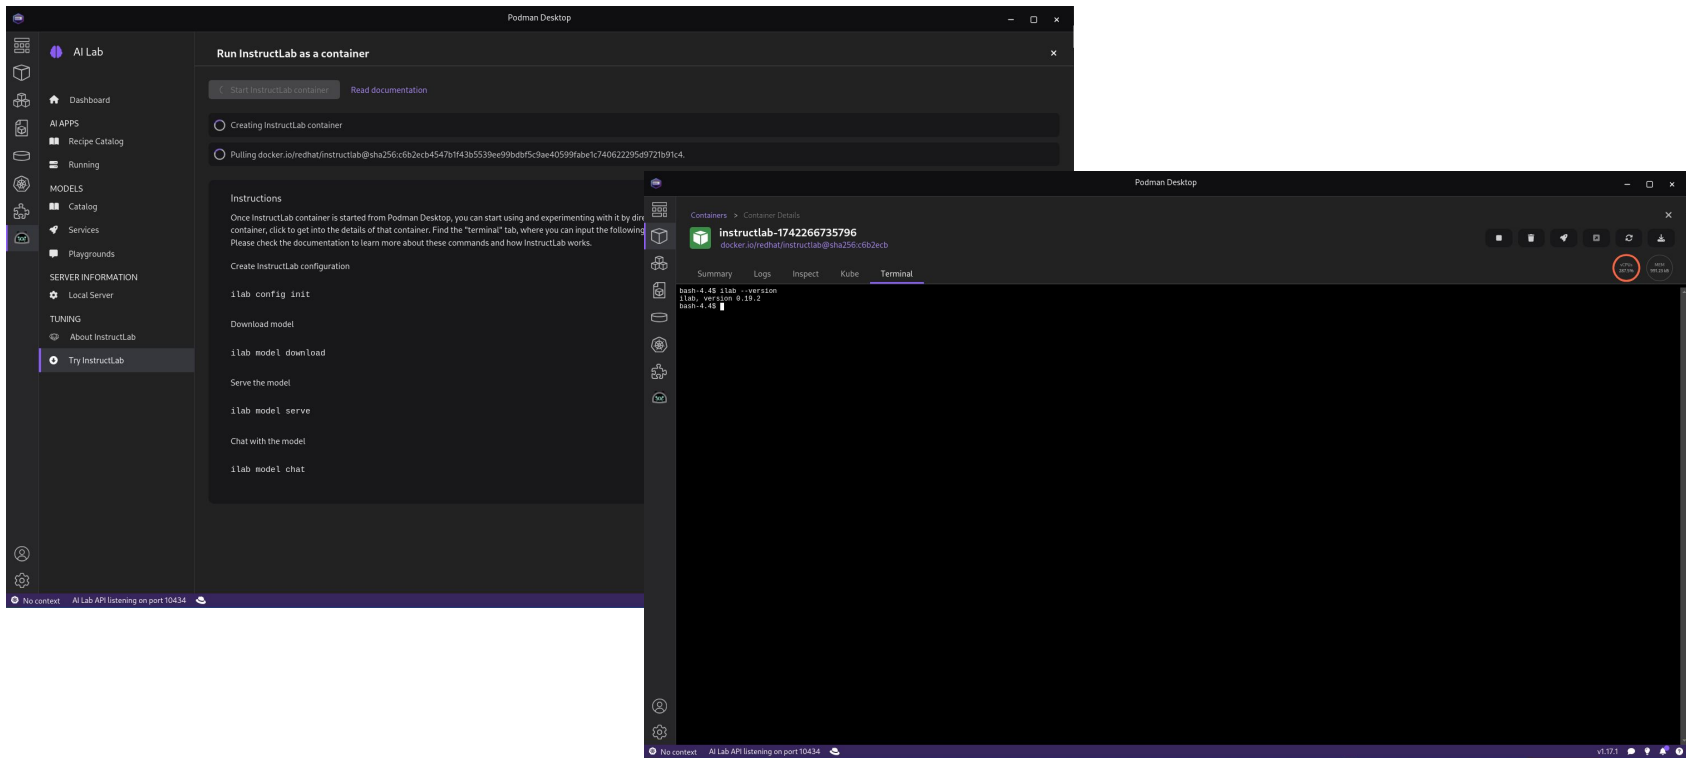

Generate additional  
training data to expand  
dataset automatically

## Model Training with New Data

Phased, large-scale  
alignment tuning (with  
knowledge and skills)

# Podman and InstructLab

# Let us see them in Action

## System and Software Prerequisites

- Software: Podman Desktop 1.10.3+ and Podman 5.0.1+.
- Hardware: At least 12GB RAM, 4+ CPUs (more is better for large models).

```
